FOR IMMEDIATE RELEASE

LINKPRO FILE REPLICATION SOFTWARE AUTOMATES WEBSITE PUBLISHING AND SERVER BACKUP

*IPREPLICATOR® contains new features for its expanding user base.
Improves automated website publishing and server backup.*

IRVINE, Calif., Jan. 7, 2008 – LinkPro Technologies, Inc., a leading developer of File Replication Software for networked servers, today announced the availability of IPReplicator version 2.8. This release contains new features that enhance the automation of website publishing and server backup. “We are continually improving IPReplicator® by incorporating new capabilities that are requested by our expanding customer base. This new version is another step forward in that process”. said Frank Reinhart, president of LinkPro.

IPReplicator® not only provides automated website publishing, it also performs continuous web and file server backup and mirroring. Efficient website publishing from a staging server to multiple live Web servers has become a necessity for today's organizations. Web pages, images, and streaming videos are updated on a regular basis. Website and file server data availability is also required 24X7.

IPReplicator's unique replication technology performs real-time, scheduled or manually triggered file replication. It supports one-to-one or one-to-many server file replication, even through firewalls, and has features that conserve and control bandwidth usage. IPReplicator's distributed replication agents combined with intuitive central management operate automatically over LANs, WANs or the Internet.

Minimum system requirements: Windows NT/2000/2003 operating system software; 256MB RAM; 50MB disk space; VGA monitor, and CD-ROM drive.
